Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.
many. This however may have been overlooked because of the difficulty of observation in such a large mass of cells.

The fungus was found in prothallia of *Aspidium falcatum, Pteris argyria,* and *P. cretica.*

It was first described by Lohde.\(^1\) Subsequently Leitgeb\(^2\) made it the subject of a thorough investigation, and grew it in a large number of species of fern prothallia.—GEO. F. ATKINSON, ITHACA, N. Y.

**Lemna Valdiviana in Massachusetts.**—Several interesting botanical excursions have been made this year in the lands recently set apart by the state of Massachusetts for public parks.

By notice sent out by the superintendent of planting for the parks, the local botanists have had the opportunity of enjoying a series of pleasant field days and comparing the work done in different portions of the reservations.

One such trip was taken on Sept. 3d through the Blue Hills region, eight miles south of Boston. This public park is thirteen miles, in circumference and includes the highest land in eastern Massachusetts (Blue Hill, 636\(^a\)), as it is also the highest land on the Atlantic coast from southern Maine to Florida. It has long been locally famous for its rocky ledges, basin-like swamps, and, on its southern side, the extensive meadows and ponds of two sorts, rocky, with clear waters, and marshy, with dark waters.

The most interesting find on that occasion was a *Lemna,* which, so far as comparison with specimens at the Gray Herbarium shows, is *Lemna Valdiviana* Philippi; and I send this note of its occurrence so far north of its usual habitat, and would be very glad to have some southern or western *L. Valdiviana* in exchange.—GEO. G. KENNEDY, READVILLE, MASS.

**Puccinia malvacearum.**—Some years ago, the late Geo. W. Clinton of Buffalo, N. Y., expressed himself as disappointed because a certain *Ranunculus* did not turn out to be *R. bulbosus.* “Why can't Buffalo have this plant?”

We have rather desired at this place the presence of living *Puccinia malvacearum,* because it was so useful for the class room. This year, for the first time, it has been introduced with some hollyhocks purchased at the east. It has already made serious attacks on half a dozen species of plants in our botanic garden and now that we have it, the thing doesn’t seem so funny.—W. J. BEAL, Agricultural College, Mich.
